Subqueries: Takeaways 🖻

by Dataquest Labs, Inc. - All rights reserved $\ensuremath{\text{@}}$ 2020

Syntax

• Subqueries in a WHERE statement

```
SELECT *
FROM table
WHERE column > (SUBQUERY_HERE);
```

• Subqueries in a WHERE statement

```
SELECT (SUBQUERY_HERE)

FROM table;
```

• Returning rows that match a list of values:

```
FROM table

WHERE column_name IN ('value1', 'value2', value3, 'value4')
```

Concepts

- A subquery is a query nested within another query and must always be contained within parentheses.
- A subquery can exist within the **SELECT**, **FROM** or **WHERE** clause.
- We can use **N** to specify a list of values we want to match against.
- When writing queries that have subqueries, we'll want to write our inner queries first.
